Create two applications using Symfony6 (or 7) framework:
1. server with API entries
2. client

1. Server stores users and groups in MySQL database.
user table: id, name, email
group table: id, name

2. CLI client accessing the server through the API:
** 2.1. should be able to add, edit, delete users and groups on the server (well, CRUD)**
** 2.2 should be able to get report with the list of users of each group.**

The ready-made project should be able to start using Docker.

Upload the solution to an SCM website of your choice and share the link, GitHub is preferrable
